Calculus

Early Transcendentals
For Kathleen,
without whose encouragement
this book would not have
been written.
Contents

1

Analytic Geometry

1.1 Lines ........................................... 16
1.2 Distance Between Two Points; Circles ................. 21
1.3 Functions ........................................ 22
1.4 Shifts and Dilations ............................... 27

2

Instantaneous Rate of Change: The Derivative

2.1 The slope of a function ............................ 31
2.2 An example ......................................... 36
2.3 Limits ............................................. 38
2.4 The Derivative Function ............................ 48
2.5 Adjectives For Functions ............................ 53
3

Rules for Finding Derivatives

3.1 The Power Rule ........................................... 57
3.2 Linearity of the Derivative .......................... 60
3.3 The Product Rule ........................................ 62
3.4 The Quotient Rule ....................................... 64
3.5 The Chain Rule .......................................... 67

4

Transcendental Functions

4.1 Trigonometric Functions .............................. 73
4.2 The Derivative of $\sin x$ .......................... 76
4.3 A hard limit ................................................. 77
4.4 The Derivative of $\sin x$, continued ........... 80
4.5 Derivatives of the Trigonometric Functions ........ 81
4.6 Exponential and Logarithmic functions ........... 82
4.7 Derivatives of the exponential and logarithmic functions .... 84
4.8 Implicit Differentiation ................................. 89
4.9 Inverse Trigonometric Functions ................ 94
4.10 Limits revisited ............................................ 97
4.11 Hyperbolic Functions ................................... 101

5

Curve Sketching

5.1 Maxima and Minima .................................... 107
5.2 The first derivative test .............................. 111
5.3 The second derivative test ......................... 112
5.4 Concavity and inflection points .................. 113
5.5 Asymptotes and Other Things to Look For ........ 115
6
Applications of the Derivative

6.1 Optimization .................................................. 119
6.2 Related Rates ................................................... 131
6.3 Newton’s Method ............................................. 139
6.4 Linear Approximations ...................................... 143
6.5 The Mean Value Theorem .................................... 145

7
Integration

7.1 Two examples ................................................. 149
7.2 The Fundamental Theorem of Calculus .................. 153
7.3 Some Properties of Integrals ............................... 160

8
Techniques of Integration

8.1 Substitution ..................................................... 166
8.2 Powers of sine and cosine .................................. 171
8.3 Trigonometric Substitutions ............................... 173
8.4 Integration by Parts ......................................... 176
8.5 Rational Functions .......................................... 180
8.6 Numerical Integration ....................................... 184
8.7 Additional exercises ......................................... 189
9

Applications of Integration

Partial Differentiation

14.1 Functions of Several Variables .................................. 349
14.2 Limits and Continuity .................................................. 353
14.3 Partial Differentiation .................................................. 357
14.4 The Chain Rule ......................................................... 363
14.5 Directional Derivatives ................................................ 366
14.6 Higher order derivatives ............................................. 371
14.7 Maxima and minima .................................................... 372
14.8 Lagrange Multipliers .................................................. 377

15
Multiple Integration

15.1 Volume and Average Height ........................................... 383
15.2 Double Integrals in Cylindrical Coordinates ...................... 393
15.3 Moment and Center of Mass ......................................... 397
15.4 Surface Area ............................................................. 400
15.5 Triple Integrals .......................................................... 402
15.6 Cylindrical and Spherical Coordinates .............................. 405
15.7 Change of Variables ................................................... 409

16
Vector Calculus

16.1 Vector Fields ............................................................. 417
16.2 Line Integrals ............................................................. 419
16.3 The Fundamental Theorem of Line Integrals ....................... 423
16.4 Green’s Theorem ......................................................... 426
16.5 Divergence and Curl .................................................... 431
16.6 Vector Functions for Surfaces ....................................... 434
16.7 Surface Integrals ........................................................ 440
16.8 Stokes’s Theorem ....................................................... 444
16.9 The Divergence Theorem ............................................. 448
Introduction

The emphasis in this course is on problems—doing calculations and story problems. To master problem solving one needs a tremendous amount of practice doing problems. The more problems you do the better you will be at doing them, as patterns will start to emerge in both the problems and in successful approaches to them. You will learn fastest and best if you devote some time to doing problems every day.

Typically the most difficult problems are story problems, since they require some effort before you can begin calculating. Here are some pointers for doing story problems:

1. Carefully read each problem twice before writing anything.

2. Assign letters to quantities that are described only in words; draw a diagram if appropriate.

3. Decide which letters are constants and which are variables. A letter stands for a constant if its value remains the same throughout the problem.

4. Using mathematical notation, write down what you know and then write down what you want to find.

5. Decide what category of problem it is (this might be obvious if the problem comes at the end of a particular chapter, but will not necessarily be so obvious if it comes on an exam covering several chapters).

6. Double check each step as you go along; don’t wait until the end to check your work.

7. Use common sense; if an answer is out of the range of practical possibilities, then check your work to see where you went wrong.
Suggestions for Using This Text

1. Read the example problems carefully, filling in any steps that are left out (ask someone for help if you can’t follow the solution to a worked example).

2. Later use the worked examples to study by covering the solutions, and seeing if you can solve the problems on your own.

3. Most exercises have answers in Appendix A; the availability of an answer is marked by “⇒” at the end of the exercise. In the pdf version of the full text, clicking on the arrow will take you to the answer. The answers should be used only as a final check on your work, not as a crutch. Keep in mind that sometimes an answer could be expressed in various ways that are algebraically equivalent, so don’t assume that your answer is wrong just because it doesn’t have exactly the same form as the answer in the back.

4. A few figures in the pdf and print versions of the book are marked with “(AP)” at the end of the caption. Clicking on this should open a related interactive applet or Sage worksheet in your web browser. Occasionally another link will do the same thing, like this example. (Note to users of a printed text: the words “this example” in the pdf file are blue, and are a link to a Sage worksheet.)
